CHAPTER III EX-IV Q-5

Find the condition that the lines

$$y + t_i x = 2at_i + at_i^3$$

where i=1,2,3, are concurrent.

$$\mathbf{t_1}\mathbf{x} + \mathbf{y} = 2\mathbf{a}\mathbf{t_1} + \mathbf{a}\mathbf{t_1^3}$$

$$\mathbf{t_2}\mathbf{x} + \mathbf{y} = 2\mathbf{a}\mathbf{t_2} + \mathbf{a}\mathbf{t_2^3}$$

$$t_3x + y = 2at_3 + at_3^3$$

SOLUTION

Considering coefficients of three lines in matrix form:

$$(t_1 \quad 1) \mathbf{x} = 2at_1 + at_1^3$$

$$(t_2 \quad 1) \mathbf{x} = 2at_2 + at_2^3$$
 (2)

$$(t_3 \quad 1) \mathbf{x} = 2at_3 + at_3^3 \tag{3}$$

The above equations form a matrix equation as below:

$$\begin{pmatrix} t_1 & 1 \\ t_2 & 1 \\ t_3 & 1 \end{pmatrix} \mathbf{x} = \begin{pmatrix} 2at_1 + at_1^3 \\ 2at_2 + at_2^3 \\ 2at_3 + at_3^3 \end{pmatrix}$$
(4)

Given the lines are concurrent, so considering above equations are consistent and are reduced to augmented form as below to find the condition for lines to be concurrent:

$$\begin{pmatrix} t_1 & 1 & -2at_1 - at_1^3 \\ t_2 & 1 & -2at_2 - at_2^3 \\ t_3 & 1 & -2at_3 - at_3^3 \end{pmatrix}$$
 (5)

Considering Transpose of above augmented form of matrix,we get:
$$\begin{pmatrix} t_1 & t_2 & t_3 \\ 1 & 1 & 1 \\ -2at_1 - at_1^3 & -2at_2 - at_2^3 & -2at_3 - at_3^3 \end{pmatrix}$$

Performing row operations on the above augmented matrix as follows:

$$\begin{pmatrix} t_{1} & t_{2} & t_{3} \\ 1 & 1 & 1 \\ -2at_{1} - at_{1}^{3} & -2at_{2} - at_{2}^{3} & -2at_{3} - at_{3}^{3} \end{pmatrix} \xrightarrow{R_{3} \leftarrow R_{3} + 2aR_{1}} \begin{pmatrix} t_{1} & t_{2} & t_{3} \\ 1 & 1 & 1 \\ -at_{1}^{3} & -at_{2}^{3} & -at_{3}^{3} \end{pmatrix} (6)$$

$$\xrightarrow{R_{3} \leftarrow R_{3}/(-a)} \begin{pmatrix} t_{1} & t_{2} & t_{3} \\ \frac{R_{3} \leftarrow R_{3}/(-a)}{1} & \frac{R_{3} \leftarrow R_{3}/(-a)}{1} & \frac{R_{3} \leftarrow R_{3}/(-a)}{1} \end{pmatrix} \begin{pmatrix} t_{1} & t_{2} & t_{3} \\ 1 & 1 & 1 \\ t_{1}^{3} & t_{2}^{3} & t_{3}^{3} \end{pmatrix}$$

Since system of equations are considered consistent, we get

$$t_1(t_2^3 - t_3^3) + t_2(t_3^3 - t_1^3) + t_3(t_1^3 - t_2^3) = 0$$
 (8)

$$t_1 t_2^3 - t_1 t_3^3 + t_2 t_3^3 - t_2 t_1^3 + t_3 t_1^3 - t_3 t_2^3 = 0 (9)$$

$$t_1 t_2 (t_2^2 - t_1^2) + t_2 t_3 (t_3^2 - t_2^2) + t_3 t_1 (t_1^2 - t_3^2) = 0$$
 (10)

Simplifying further Equation (10) we get

(4)
$$(t_1t_2(t_2 - t_1)(t_2 + t_1)) + (t_2t_3(t_3 - t_2)(t_3 + t_2)) + (t_3t_1(t_1 - t_3)(t_1 + t_3)) = 0$$
(11)

Therefore Equation (11) represents the condition for the three lines to be concurrent.
