CHAPTER III EX-IV Q-5

Find the condition that the lines

$$y + t_i x = 2at_i + at_i^3$$

where i=1,2,3, are concurrent.

$$t_1x + y = 2at_1 + at_1^3$$

$$\mathbf{t_2}\mathbf{x} + \mathbf{y} = 2\mathbf{a}\mathbf{t_2} + \mathbf{a}\mathbf{t_2^3}$$

$$\mathbf{t_3}\mathbf{x} + \mathbf{y} = 2\mathbf{a}\mathbf{t_3} + \mathbf{a}\mathbf{t_3^3}$$

SOLUTION

Considering coefficients of three lines in matrix form :

$$(t_1 \quad 1) \mathbf{x} = 2at_1 + at_1^3 \tag{1}$$

$$(t_2 1) \mathbf{x} = 2at_2 + at_2^3 (2)$$

$$(t_3 1) \mathbf{x} = 2at_3 + at_3^3 (3)$$

The above equations form a matrix equation as below:

$$\begin{pmatrix} t_1 & 1 \\ t_2 & 1 \\ t_3 & 1 \end{pmatrix} \mathbf{x} = \begin{pmatrix} 2at_1 + at_1^3 \\ 2at_2 + at_2^3 \\ 2at_3 + at_3^3 \end{pmatrix}$$
(4)

Given the lines are concurrent, so considering above equations are consistent and are reduced to augmented form as below to find the condition for lines to be concurrent:

$$\begin{pmatrix} t_1 & 1 & 2at_1 + at_1^3 \\ t_2 & 1 & 2at_2 + at_2^3 \\ t_3 & 1 & 2at_3 + at_3^3 \end{pmatrix}$$
 (5)

Considering Transpose of above augmented form of matrix and performing row operations below:

$$\begin{pmatrix} t_1 & t_2 & t_3 \\ 1 & 1 & 1 \\ 2at_1 + at_1^3 & 2at_2 + at_2^3 & 2at_3 + at_3^3 \end{pmatrix}$$
Performing

row operations on the above augmented matrix as follows:

$$\begin{pmatrix} t_1 & t_2 & t_3 \\ 1 & 1 & 1 \\ 2at_1 + at_1^3 & 2at_2 + at_2^3 & 2at_3 + at_3^3 \end{pmatrix}$$

$$R_3 \leftarrow R_3 - 2aR_1$$

$$\begin{pmatrix} t_1 & t_2 & t_3 \\ 1 & 1 & 1 \\ at_1^3 & at_2^3 & at_3^3 \end{pmatrix}$$

$$R_3 \leftarrow R_3/a$$

$$\begin{pmatrix} t_1 & t_2 & t_3 \\ 1 & 1 & 1 \\ at_1^3 & t_2^3 & t_3^3 \end{pmatrix} \leftrightarrow \begin{pmatrix} t_1 & 1 & t_1^3 \\ t_2 & 1 & t_2^3 \\ t_3 & 1 & t_3^3 \end{pmatrix}$$

$$R_2 \leftarrow R_2 - R_1$$

$$R_3 \leftarrow R_3 - R_1$$

$$\begin{pmatrix} t_1 & 1 & t_1^3 \\ t_2 - t_1 & 0 & t_2^3 - t_1^3 \\ t_3 - t_1 & 0 & t_3^3 - t_1^3 \end{pmatrix}$$

$$R_2 \leftarrow R_2/(t_2 - t_1)$$

$$R_3 \leftarrow R_3/(t_3 - t_1)$$

$$R_2 \leftarrow R_2/(t_2 - t_1)$$

$$R_3 \leftarrow R_3/(t_3 - t_1)$$

$$(t_2 - t_1)(t_3 - t_1) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 1 & 0 & t_2^2 + t_1^2 + t_1 t_2 \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$R_2 \leftarrow R_2 - R_3$$

$$(t_2 - t_1)(t_3 - t_1) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 0 & 0 & t_2^2 - t_3^2 + t_1 t_2 - t_1 t_3 \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$(t_2 - t_1)(t_3 - t_1) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 0 & 0 & (t_2 - t_3)(t_2 + t_3 + t_1) \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$R_2 \leftarrow R_2/(t_2 - t_3)$$

$$(t_2 - t_1)(t_3 - t_1)(t_2 - t_3) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 0 & 0 & (t_2 + t_3 + t_1) \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$R_2 \leftarrow R_2/(t_2 - t_3)$$

$$(t_2 - t_1)(t_3 - t_1)(t_2 - t_3) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 0 & 0 & (t_2 + t_3 + t_1) \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$(t_2 - t_1)(t_3 - t_1)(t_2 - t_3) \begin{pmatrix} t_1 & 1 & t_1^3 \\ 0 & 0 & (t_2 + t_3 + t_1) \\ 1 & 0 & t_3^2 + t_1^2 + t_3 t_1 \end{pmatrix}$$

$$(t_3 - t_1)(t_3 - t_1)(t_3 - t_1)(t_3 - t_3)(t_3 - t_3)(t_3 - t_3 + t_1^2 + t_3 t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^2 + t_3 t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^2 + t_3 t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_1^3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3 - t_3)(t_3 - t_3 + t_3^3$$

$$(t_3 - t_1)(t_3$$

Since system of equations are considered consistent, we get

$$(t_2 - t_1)(t_3 - t_1)(t_2 - t_3)(t_2 + t_3 + t_1) = 0 (7)$$

$$(t_1 - t_2)(t_2 - t_3)(t_3 - t_1)(t_1 + t_2 + t_3) = 0$$
 (8)

Therefore Equation (8) represents the condition for the three lines to be concurrent.

Now considering lines as follows:

$$2x + 3y = 11$$
 $2x - 4y = -24$
 $-x - y = -3$
(9)

Considering Transpose of above augmented form of matrix and performing row operations below:

$$\begin{pmatrix} 2 & 3 & 11 \\ 2 & -4 & -24 \\ -1 & -1 & -3 \end{pmatrix}$$

$$R_{2} \leftarrow R_{2} - R_{1}$$

$$R_{3} \leftarrow 2R_{3} + R_{1}$$

$$\begin{pmatrix} 2 & 3 & 11 \\ 0 & -7 & -35 \\ 0 & 1 & 5 \end{pmatrix}$$

$$R_{3} \leftarrow 7R_{3} + R_{2}$$

$$\begin{pmatrix} 2 & 3 & 11 \\ 0 & 7 & -35 \\ 0 & 0 & 0 \end{pmatrix}$$

$$(10)$$

From above matrix, it can be said that the given system of lines are consistent . Hence given lines are concurrent as the condition for lines to be concurrent is satisfied.
